

User Experience and Design of UI and Services

UXI 2025/26 project

Student–Professor Appointment System

team: **Adar Otieno**, xotiena00
 Deniz Aksoy, xaksoyd00
 Eyobed Awel Nuri, xnuriey00
 Pengwei Jiang, xjiangp00

Mengran Zhao, xzhaome00

Project Goal

The goal of this project is to design and implement a user-friendly appointment scheduling system that improves the interaction between professors and students in an academic environment.

Problem Definition

In many universities, scheduling meetings between students and professors is often inefficient and fragmented. Common issues include:

1. Lack of a centralized system for managing appointments
2. Manual coordination via email or messaging platforms
3. Difficulty in tracking available time slots
4. Overlapping or conflicting appointments
5. Poor user experience and lack of transparency

These challenges lead to wasted time, miscommunication, and frustration for both students and **professors**.

Proposed Solution

To address these problems, we developed SyncUp, a digital platform that simplifies and streamlines the appointment booking process. It is designed for desktop and mobile.

The application provides:

1. A centralized system for managing appointments
2. A structured interface for professors to define availability
3. A simple and intuitive booking process for students
4. Real-time visibility of available time slots
5. Automated organization of appointments

First figma design for schedule management page for professor

First figma design for booking page for students

User and Use Cases

Target Users

The SyncUp application is designed for two primary user groups within an academic environment:

1. Students (e.g., Deniz Aksoy)
2. Professors (e.g., prof. Ing. Adam Herout Ph.D)

These two roles have different goals, behaviors, and expectations, which directly shape how they interact with the system.

Student Perspective

Students are typically under time pressure due to coursework, deadlines, and part-time work. They prefer fast, structured, and predictable systems over informal communication methods such as email.

From our analysis, students mainly want:

- Quick access to available consultation slots
- The ability to book appointments instantly without negotiation
- Clear confirmation and reminders
- A simple and minimal interaction flow

"If the slot is available, I should be able to book it instantly."

Deniz Aksoy
Master Student-
Information Technology

Age: 25
Role: MSc Student – Information Technology
Status: Full-time student, part-time working
Tech proficiency: High (Git, Docker, Linux)

Core Goal
Quickly book confirmed consultation slots without email negotiation.

Background

- Takes 4–5 technical courses per semester
- Works part-time remotely 2 days/week
- Frequently faces assignment deadlines
- Uses mobile during the day, desktop in the evening

Pain Points

- Email back-and-forth to schedule meetings
- Unclear office hours (PDF, website, email formats differ)
- Double bookings or no confirmation
- Missed appointments due to lack of reminders

Needs from the System

- Real-time availability display
- One-click booking
- Instant confirmation
- Calendar synchronization
- Automated reminders

Behavioral Traits

- Time-sensitive decision maker
- Prefers structured digital tools
- Avoids uncertainty
- Values efficiency over formality

Usage Context

- Books consultations mostly 2–3 days before deadlines
- Uses phone between classes
- Checks notifications frequently

UX Implications

- Minimal steps (max 3-click booking flow)
- Clear availability visualization (calendar grid view)
- Confirmation state clearly visible
- Push notification reminders

Their current pain points include:

- Time-consuming email exchanges with professors
- Unclear or inconsistent office hour information
- Risk of double booking or missed appointments

Professor Perspective

Professors manage a large number of students and consultations, often alongside teaching and research responsibilities. Therefore, they prioritize efficiency, control, and organization.

From the persona, professors need:

- A structured way to define availability
- Control over consultation times and durations
- A clear overview of scheduled appointments
- Reduction of repetitive scheduling communication

Their main challenges include:

- Multiple students requesting the same time slot
- High volume of emails related to scheduling
- Difficulty tracking consultations and cancellations

Dr. Martin Svoboda

Associate Professor – Robotics & AI

Age: 45
Role: Associate Professor – Robotics & AI
Tech proficiency: Moderate

Core Goal

Control consultation load and avoid scheduling chaos.

Background

- Teaches 2 large courses (200+ students)
- Supervises thesis students
- Has limited weekly consultation hours
- Receives 20–30 academic emails per day

Pain Points

- Multiple students request same time slot via email
- Students do not specify consultation topic
- Last-minute cancellations
- Difficulty tracking past consultations

Needs from the System

- Ability to define weekly availability
- Slot duration control (e.g., 15 min blocks)
- Topic selection requirement
- Cancellation policy enforcement
- Overview dashboard

Behavioral Traits

- Prefers structure and predictability
- Values academic efficiency
- Limited tolerance for repeated scheduling messages

Usage Context

- Sets availability once per week
- Reviews daily consultation list each morning
- Needs quick overview, not complex UI

UX Implications

- Admin panel with simple availability setup
- Topic dropdown (Thesis / Exam / Assignment / Other)
- Daily overview dashboard
- Automatic email confirmation

“Consultations should be structured, not negotiated.”

Use Cases

Based on these user needs, we identified the following key use cases:

Student Use Cases

- **Browse Available Slots** : The student views available time slots for a selected professor in a clear and structured interface.
- **Book Appointment** : The student selects a suitable time slot and confirms the booking in one step.
- **Receive Confirmation** :The system provides immediate confirmation and stores the appointment.
- **Manage Appointments** :The student can view, cancel, or modify existing bookings.

Professor Use Cases

- Create Availability Slots : The professor defines available consultation times for specific days.
- Manage Schedule : The professor reviews upcoming appointments in the calendar view.
- Control Appointment Structure : The professor can define slot durations and require additional information (e.g., consultation topic).
- Handle Cancellations : The system helps manage cancellations and updates availability accordingly.

User Experience Considerations

The interaction design of SyncUp is directly influenced by user behavior and needs:

1. Students require minimal steps and fast booking
2. Professors require structured control and overview
3. Both users benefit from clear communication and automation

Therefore, the system is designed to:

- Reduce manual interaction (e.g., email exchanges)
- Provide real-time availability updates
- Ensure clarity and transparency in scheduling
- Support efficient time management for both roles

Important and Interesting Parts of the Project

1. Real-Time Appointment Availability

It is important because students need instant access to available slots without delay also this design prevents double booking and scheduling conflicts besides that it eliminates uncertainty in the booking process.

Student Page- Professor's availability at specific date (desktop view)

Student Page- Creating appointment

Student Page- Student dashboard for checking upcoming meetings and searching professor

Student Page- After booking, professor calendar is updated

Student Page - Booking process (mobile view)

Student Page - Booking process (mobile view)-2

2. One-Click Booking Experience

It is important because of time sensitivity and minimal interaction between app and user.

Student Page – Automatic booking after confirmation

3. Professor Availability Management

Professors have limited time, so a structured system with weekly slot creation, controllable durations, and predefined topics helps reduce scheduling chaos and manage consultations efficiently. It is important because of time sensitivity and minimal interaction

The 'Add' form in the SyncUp application includes the following fields and options:

- Title:** Consultation
- Location:** Room 202
- Date:** 4/5/2026
- Time:** 09:00 - 12:00
- Slots:** 3 (with minus and plus buttons)
- Break:** 5 min (with minus and plus buttons)
- Max:** 2 (with minus and plus buttons)
- Online meeting:** Toggle switch (currently off)
- Can cancel until:** 1 day before
- Repeat:**
 - ☐ No repeat
 - ☐ Every day
 - ☒ Every week
 - ☐ Every month
- + Add schedule** button at the bottom.

Professor Page – Schedule/Slot management page

The 'Added slots' view shows a weekly calendar for May 17-23, 2026. The calendar displays two consultation slots on Monday:

Sun	Mon	Tue	Wed	Thu	Fri	Sat
	Consultation 50 min • Room 202					
	Consultation 50 min • Room 202					

The right side of the calendar shows time slots from 10:15 to 12:00. A green box highlights the date range 'May 17-23 2026' and the 'Next 2 weeks' link.

Professor Page – Weekly calendar view

The mobile view of the SyncUp app shows the 'Add' form and the resulting 'Added slots' calendar. The first screenshot shows the 'Configure' step with the following settings:

- Select Day:** Wed
- Start time:** 10:00 AM
- Duration:** 30 min
- Break after slot:** 10 min
- Repeat:** Every day

The second screenshot shows the 'Review batch' step with the following details:

- Date:** 5/5/2026
- Time:** 09:00 - 12:00
- Slots:** 3
- Break:** None
- Max:** 2
- Online meeting:** Toggle switch (currently on)
- Meeting link:** https://zoom.com
- Can cancel until:** 1 day before
- Repeat:** Every day

The third screenshot shows the 'Added slots' view for May 3-9, 2026, with a total of 42 slots. A notification at the bottom states: 'Added 21 slots: consultation'.

Professor Page – adding Slot (mobile view)

4. Reduction of Email-Based Communication

Instead of contacting students one by one, professors can postpone or cancel appointments directly through the system and send a message to all affected students at once, reducing repetitive communication and preventing misunderstandings.

Professor Page - Bulk actions allow professors to manage and notify multiple students efficiently.

Professor Page- Information message is received after postponed action

Professor Page -Bulk operations (mobile view)

Used Technologies and Tools

The SyncUp application was developed using a combination of modern frontend, backend, and development tools to ensure scalability, usability, and efficient development.

1. Frontend Development : Flutter (Dart) is used to develop a cross-platform application with a consistent and responsive user interface across mobile and web platforms.

2. Backend and Database : PocketBase is used as a lightweight backend solution that provides database management, authentication, and API services for the application.

3. Platforms and Deployment Targets : The application is designed to run seamlessly across multiple platforms including Android, iOS, web, and desktop (Windows, macOS, Linux) using Flutter's cross-platform capabilities.

4. Development Tools

- Visual Studio Code (VS Code) : Main development environment for writing and debugging code.
- Git & GitHub : Version control and collaboration, it is used for managing project versions and teamwork.

5. Design and Prototyping: Figma is used for designing the user interface and user experience .It enables rapid prototyping and visualization of application screens.

6. Project Structure and Configuration

- pubspec.yaml : Manages dependencies and project configuration
- Flutter SDK : Required to build and run the application
- PocketBase Server : Must be running (local or remote) for database connectivity

7. Additional Functionalities

- REST API Communication : The frontend communicates with PocketBase via HTTP requests.
- Authentication System : User login and registration handled via PocketBase

Design Preliminaries

The UI design of SyncUp was developed based on a user-centered approach, focusing on understanding the needs, behaviors, and challenges of both students and professors. The design process was guided by personas, use case analysis, and usability requirements.

1. Persona-Based Design

The interface design was strongly influenced by two primary personas:

1. Student Persona : The student needs a fast and simple booking process with minimal steps, instant feedback, and a mobile-friendly experience.
2. Professor Persona : The professor requires structured control over their schedule, prioritizing efficiency, clarity, and a clear overview of multiple appointments.

2. Use Case Analysis

We identified the key interactions between users and the system by focusing on how students and professors engage with the scheduling process.

Students primarily browse available time slots and book appointments based on their needs, while professors create and manage their availability through structured time slots. Both user groups interact within a centralized and organized scheduling system that connects these actions seamlessly.

Based on this analysis, the interface was designed to ensure that common tasks require minimal steps, while all actions remain clearly visible, intuitive, and easy to understand for both students and professors.

3. Design Requirements

Based on user needs, we defined the following UI requirements:

1. Simplicity: Minimal steps for booking
2. Clarity: Clear visualization of available and booked slots
3. Efficiency: Fast interaction with no unnecessary actions
4. Feedback: Instant confirmation after actions
5. Consistency: Same design language across all screens

4. UX Design Decisions

Key decisions made during the design process:

1. Calendar-based slot visualization for better understanding

Student Page - The calendar-based interface allows students to clearly see available time slots and make quick booking decisions

Professor Page- Professors use a structured calendar view to manage and organize their availability efficiently

2. One-click or minimal-click booking flow

3. Separate interfaces for student and professor roles

Professor Home Page

Student Home Page

4. Bulk actions for professors to manage multiple appointments

5. Clear status indicators (available / booked / cancelled)

Professor Page – Available and booked slots for specific date

Student Page- Booking cancellation

Student Page – Notification is received after an action

Testing

To evaluate the usability and effectiveness of the SyncUp application, we conducted several tests focusing on user interaction, system behavior, and overall user experience. The goal of these tests was to validate our design decisions and identify potential usability issues.

1. Usability Testing

We tested the application with representative user scenarios based on our defined personas (student and professor).

1. Test scenario for student : Users were asked to find an available slot and book an appointment.
2. Test scenario for professor : Users were asked to create availability slots and manage existing appointments.

Findings:

Students were able to complete the booking process quickly with minimal confusion, indicating that the interface supports an intuitive and efficient user flow. The calendar view proved effective in helping users clearly distinguish between available and occupied time slots, improving overall understanding and decision-making. Professors also found the slot creation process intuitive; however, some actions would benefit from clearer labeling to further enhance usability.

As a result the system successfully supports fast and simple interactions, but minor improvements in UI clarity and labeling could further enhance the user experience.

Student Page- Students can easily identify available slots and book appointments through a clear and intuitive calendar interface.

2. Interaction Flow Testing

We analyzed how many steps are required to complete key tasks.

- Booking an appointment required only a few steps (select → confirm)
- Managing appointments was straightforward from both user perspectives

Findings:

- The minimal-step design reduced user effort
- Users preferred direct actions instead of multi-step processes

As a result, a simplified interaction flow improves efficiency and aligns with user expectations.

3. Role-Based Testing

We tested the system separately for student and professor roles.

Findings:

- Students benefited from a clean and simple interface
- Professors required more control and preferred structured dashboards

Designing different interfaces for different user roles is essential for balancing simplicity and control.

4. Error and Edge Case Testing

We tested potential problematic scenarios such as:

- Booking an already occupied slot
- Cancelling or postponing appointments
- Handling multiple bookings

Findings:

- The system prevented double booking effectively
- Bulk actions (e.g., notifying multiple students) improved efficiency
- Users expected clear feedback after actions

As a result; we saw that proper error handling and feedback mechanisms are critical for user trust and system reliability.

Most Important Achieved Results

The final UI design of SyncUp successfully delivers a simple, efficient, and structured appointment scheduling experience for both students and professors. The most important achievement of the system is the balance between ease of use for students and control for professors, which was a key goal from the beginning.

1. Clear and Intuitive Booking Interface for Student

One of the most important results is the development of a clean and intuitive booking interface. The calendar-based layout allows students to quickly identify available time slots and make decisions without confusion. The use of clear visual indicators (e.g., available vs. full slots) significantly improves usability and reduces cognitive load.

Student Page- Professor search field

Student Page – List available slots for booking

Student Page – Booking pop-up

Student Page – Confirmation message

Student Page – New appointment is added to “my meetings” list

The interface enables students to complete the booking process in just a few steps, which directly supports our goal of minimizing interaction effort and improving efficiency.

2. Structured Schedule Management for Professor

Another key achievement is the structured interface designed for professors. The system provides a clear overview of weekly schedules, allowing professors to easily manage multiple appointments and define their availability.

Professor Page – Weekly overview

3. Bulk Actions for Efficient Communication

A particularly strong feature of the system is the ability for professors to manage multiple appointments simultaneously. Instead of contacting students individually, professors can select multiple appointments and perform bulk actions such as postponing or sending notifications.

4. Consistent and Clean UI Design

The overall design maintains consistency across all screens, including layout, colors, and interaction patterns. This consistency improves learnability and reduces user confusion. Additionally, the system supports both light and dark modes, allowing users to choose their preferred visual environment.

The consistent design improves learnability and reduces user confusion, while the support for light and dark modes enhances user comfort and accessibility, especially during prolonged use or different lighting conditions.

Distribution of the Work in the Team

Deniz: Led the team, contributed to UI design in Figma, prepared the project report and presentation slides, and participated in application testing.

Adar & Eyoubed: Responsible for designing the backend architecture and implementing backend functionalities, including selecting appropriate technologies and developing the system infrastructure.

Mengran: Contributed to frontend development, participated in testing, and was involved in preparing and presenting the project slides.

Pengwei: Focused on frontend development, assisted in presentation preparation, and contributed to dataset creation.

All team members actively collaborated throughout the project, supporting each other when needed and occasionally working across both frontend and backend to ensure smooth integration and project success.

What Was the Biggest Challenge

The biggest challenge during the project was balancing the different needs of students and professors while designing a system that is both simple and structured.

Students required a fast and intuitive booking experience with minimal steps, while professors needed more control over their schedules, including managing availability, handling multiple appointments, and performing actions such as cancellations or postponements. Designing a single system that satisfies both simplicity and control was a complex task and required multiple design iterations.

Another challenge was integrating the frontend with the backend system. Ensuring that real-time availability, booking updates, and cancellation actions were correctly synchronized between users required careful coordination and testing. Preventing issues such as double booking and maintaining data consistency took time and effort.

Additionally, organizing the overall user flow and reducing unnecessary complexity was challenging. We had to continuously refine the interface to make it clear, intuitive, and efficient, especially for first-time users.

Experience Gained From the Project

Throughout the development of the SyncUp project, we gained valuable experience in both technical and non-technical aspects of software development. This project allowed us to combine frontend, backend, and design knowledge while working collaboratively as a team.

From a programming perspective, we improved our skills in Flutter (Dart) by building a cross-platform application with a structured and responsive user interface. We learned how to design reusable components, manage UI states, and create efficient user flows. In addition, working with PocketBase helped us understand how to integrate a lightweight backend system, including handling authentication, managing collections, and communicating with the database through API requests.

In terms of UI/UX design, we learned how important it is to design based on user needs rather than assumptions. By using personas and use case analysis, we developed a better understanding of how different users interact with the system. We also gained experience in Figma, where we created and refined interface designs, focusing on simplicity, clarity, and consistency. Supporting features such as calendar-based interaction and light/dark mode further strengthened our understanding of modern UI design principles.

Another important learning outcome was related to system integration. Connecting the frontend with the backend and ensuring that data such as availability and bookings are synchronized correctly required careful

planning and testing. We learned how to handle real-time interactions, prevent issues like double booking, and maintain data consistency.

Beyond technical skills, we significantly improved our teamwork and collaboration abilities. Working in a group required clear communication, task distribution, and mutual support. We learned how to divide responsibilities effectively while still collaborating across different parts of the project when needed.

Finally, we developed better time management and project organization skills. Coordinating design, development, testing, and reporting within limited time required planning and prioritization. This helped us understand the importance of structured workflows in real-world projects.

What we have Discovered

During the SyncUp project, we discovered that building a useful application is not only about implementing features, but also about understanding the real problems behind user behavior. A simple appointment system becomes more complex when different users have different expectations, responsibilities, and levels of control.

As a team, we discovered that students and professors do not need the same interface. Students mainly need speed, clarity, and a simple booking flow, while professors need control, overview, and tools for managing multiple appointments. This helped us understand the importance of role-based UI design.

We also discovered that small UX decisions can have a big impact. For example, showing appointments in a calendar view, using clear status indicators, and allowing bulk actions for professors can make the system much easier and more efficient to use.

From a technical perspective, we discovered how important frontend-backend integration is. Even if the interface looks good, the system only works properly when availability, booking, cancellation, and user data are synchronized correctly through the backend.

Individually, I (Deniz) discovered that leading a team requires not only organizing tasks, but also keeping the project direction clear and making sure that design, report, presentation, and testing parts support the same project goal. Through Figma design, reporting, and testing, I also discovered how important it is to explain design decisions clearly, not only create them visually.

Autoevaluation

Problem Selection: 80%

The selected problem was highly relevant, as appointment scheduling between students and professors is a common and practical issue in academic environments. As students ourselves, we have directly experienced the inefficiencies of email-based scheduling, which helped us better understand the problem and design a solution based on real needs rather than assumptions. This made the project more meaningful and user-centered. However, the problem space was somewhat limited in scope, and adding more advanced features or constraints could have made it more complex and comprehensive.

Problem Analysis: 85%

We conducted a solid analysis using personas, use cases, and requirement definition, which helped guide our design decisions effectively. The distinction between student and professor needs was clearly identified and reflected in the system. However, the analysis could have been further improved by including more detailed user research or real user feedback.

Testing: 65%

We performed usability and interaction flow testing based on realistic scenarios, which provided useful insights into the system's strengths and weaknesses. The results helped validate our design decisions.

However, testing was relatively limited in scale, and involving more users or conducting more structured testing methods would have improved the reliability of the findings.

UI Design: 85%

The UI design is one of the strongest parts of the project. The interface is clean, intuitive, and structured, with a clear separation between student and professor roles. Features such as calendar-based interaction, minimal booking flow, and support for light/dark mode enhance usability. Some minor improvements in labeling and visual feedback could further refine the experience.

Use of Resources: 80%

We effectively used modern tools and technologies such as Flutter, PocketBase, and Figma, which allowed us to develop the system efficiently without unnecessary complexity. We avoided reinventing common functionalities by relying on existing frameworks. However, the use of external references and literature could have been expanded to support design decisions more strongly.

Team Cooperation: 90%

Team collaboration was very effective throughout the project. Tasks were clearly distributed, and team members supported each other when needed. Communication was consistent, and responsibilities were handled reliably. Additionally, flexibility in working across frontend and backend contributed to the overall success of the project.

Overall Impression: 85%

Overall, the project successfully achieved its main goal of creating a user-friendly appointment scheduling system. We gained valuable experience in UI design, frontend-backend integration, and teamwork. While there is room for improvement in testing depth and advanced features, the final result is practical, well-structured, and demonstrates a strong understanding of user-centered design.

Recommendation for Assigning Future Projects

Overall, the project organization was well-structured and allowed us to work on a realistic and meaningful problem. One of the most positive aspects was the freedom to choose our own project topic, which increased motivation and made the work more engaging, especially since we selected a problem we personally experienced. The emphasis on UI/UX design, including personas, use cases, and testing, was also very valuable and should definitely be preserved.

Another strong point was the balance between practical implementation and theoretical analysis. Combining design, development, and evaluation helped us gain a more complete understanding of the system.

However, some aspects could be improved. The expectations for certain parts of the project, especially testing and evaluation, could be more clearly defined with examples or guidelines. This would help ensure more consistent depth across different teams. Additionally, providing intermediate checkpoints or feedback sessions during the project would be beneficial, as it would allow teams to validate their direction earlier and make improvements before the final submission.

For future projects, it would be useful to:

- Maintain the freedom of topic selection and focus on real-world problems
- Continue emphasizing user-centered design and testing
- Provide clearer guidelines and examples for evaluation sections
- Introduce more structured feedback during the development process

Overall, the project was very beneficial and helped us develop both technical and design-oriented skills, and its general structure should be preserved with minor improvements.

Recommendation for Future Students

For future students, we recommend selecting a project based on a real problem that you personally experience or understand well. This makes the design process much easier, as you can better empathize with the users and make more meaningful decisions. In our case, choosing a scheduling problem that we faced as students helped us stay motivated and focused throughout the project.

When choosing technologies, it is important to select tools that are powerful but not overly complex. Using frameworks like Flutter and lightweight backend solutions such as PocketBase allowed us to focus more on UI/UX design instead of spending too much time on infrastructure. Avoid choosing technologies that are too difficult to learn within the limited project time.

Another important recommendation is to start with design before implementation. Defining personas, use cases, and basic UI structure early on will save a lot of time later. Jumping directly into coding without a clear design can lead to confusion and rework.

One of the main challenges we faced was integrating the frontend with the backend and ensuring that data (such as available slots and bookings) is synchronized correctly. Therefore, we recommend testing these interactions early and not leaving integration to the final stage.

We also suggest allocating enough time for testing and evaluation, as these parts are often underestimated. Testing with real scenarios helps identify usability issues that are not obvious during development.

From a teamwork perspective, clear communication and task distribution are essential. At the same time, be flexible and support each other when needed, especially when integrating different parts of the system.

Miscellaneous

The application is deployed and accessible via the following link: <http://161.97.70.30:8088/> and supports both desktop and mobile access, providing a flexible and platform-independent user experience.
