## 1 Project Name and Team

### Project Identifier

SyncUp

### Project Description

A user-friendly cross-platform appointment scheduling system designed to simplify booking meetings between students and professors. It provides role-based interfaces to ensure quick scheduling for students and efficient management for professors.

### Team

Names of the core team members and their emails.

| Name and Surname | Email (Primary)    | Faculty |
|------------------|--------------------|---------|
| Adar Otieno      | xotiena00@vutbr.cz | FIT VUT |
| Eyobed Awel Nuri | xnuriey00@vutbr.cz | FIT VUT |
| Pengwei Jiang    | xjiangp00@vutbr.cz | FIT VUT |
| Mengran Zhao     | xzhaome00@vutbr.cz | FIT VUT |

*Note: The project team consists of international students and our primary language of communication is English.*

## 2 Product

### 2.1 Target Product

A cross-platform application (desktop and mobile) featuring a calendar-based interface, minimal booking flow, and support for light/dark modes. It includes a clear separation between student and professor roles. Students have an interface optimized for speed and clarity in booking, while professors are equipped with tools for controlling, overviewing, and bulk-managing multiple appointments. Additionally, the system will integrate our dedicated indoor mapping solution to provide seamless door-to-door navigation for scheduled appointments.

### 2.2 Benefit

Currently, scheduling academic appointments often relies on inefficient email communication. Our system benefits both students and professors by saving time, reducing miscommunication, and providing a centralized overview of consultations. It directly addresses a common and practical issue in academic environments based on real user needs.

## 3 Product Development

### 3.1 Current State of the Project

The project currently has a working MVP that is deployed and accessible. The frontend-backend integration using Flutter and PocketBase is fully synchronized, handling availability, booking, cancellation, and user data. Initial usability and interaction flow testing have been conducted.

Figure 1: SyncUp MVP User Interface

## 3.2 Target State within the Competition

During the competition (June–August), we will focus on:

- **Indoor Mapping Integration:** Integrating door-to-door routing for scheduled appointments.
- **Advanced Scheduling:** Implementing complex booking constraints and integrating directly with university calendars (e.g., IS VUT).
- **Validation:** Scaling our user testing phase to gather feedback.

## 3.3 Technology

- **Frontend:** Flutter (cross-platform framework for desktop and mobile)
- **Backend:** PocketBase (lightweight backend solution)
- **Design & Prototyping:** Figma

# 4 Optional

## 4.1 Link to Study

As students, we directly experienced the inefficiencies of email-based scheduling, which motivated this project. The system design and evaluation leverage our academic knowledge in UI/UX(course UX1) and software engineering.

## 4.2 Financial Plan

Estimated costs for MVP deployment include server hosting for the PocketBase backend (approx. \$5–\$10/month). Future publishing would require an Apple Developer account (\$99/year) and Google Play Console access (\$25 one-time fee).
